

IMIDAZOLE DERIVATIVES, THEIR PRODUCTION AND USE

Technical Field

The present invention relates to a novel imidazole
5 derivative useful for preventing or treating arterial and
venous thrombotic obstructive disease, inflammation, cancer
and the like, which has anti-coagulation activity and anti-
thrombosis activity by inhibiting activated blood
coagulation factor X (FXa), and production and use thereof.

10

Background Art

For preventing and treating myocardial infarction,
cerebral thrombosis and the like, it is important to
inhibit formation of thrombi and, an anti-thrombin agent, a
15 platelet aggregation inhibitor and the like as a thrombosis
inhibitor have been studied and developed variously.

However, as well as a platelet aggregation inhibitor, an
anti-thrombin agent not only has anti-coagulation activity
but also inhibits aggregation of platelet. Thus these
20 drugs tend to cause bleeding or the like as side effect and
thereby have a problem of their safety. On the other hand,
it is thought that an FXa inhibitor inhibits only a
coagulation factor specifically and therefore it may be a
safe anticoagulant.

25 To date, compounds having FXa inhibiting activity have

been disclosed, for example, in JP-A 7-112970, JP-A 5-208946, WO 96/16940, WO 96/40679, WO 96/10022, WO 97/21437, WO 99/26919, WO 99/33805, WO 00/09480, WO 01/44172, WO 02/06234, US Patent Application Publication No.

Objective of the Invention

10 There is a need for development of a novel compound useful as a thrombosis treating agent, which has improved drug efficacy, oral absorbability and duration of action and has fewer side effects, as compared with previous FXa inhibitors.

15 Summary of the Invention

The present inventors studied intensively, considering that an imidazole derivative having high selectivity for and potent inhibitory activity on FXa may exert lasting and sufficient effect when orally administered and therefore it
20 may be useful for preventing and treating arterial and venous thrombotic obstructive disease, inflammation and cancer.

As a result, the present inventors found that a novel imidazole derivative represented by the following formula
25 (I) or a salt thereof [hereinafter referred to as Compound

(I) in some cases] has selective and potent FXa inhibitory activity, is highly safe, and exerts lasting and sufficient effect when orally administered, and then completed the present invention.

A pharmaceutical composition of the present invention
5 containing Compound (I) or a salt thereof is safe and low
toxic and can be used safely. A daily dose of a
pharmaceutical composition of the present invention varies
depending on the condition and body weight of a patient,
the kind of a compound, an administration route and the
10 like. For example, when it is administered orally to an
adult patient (body weight about 60 kg) with thrombosis,
the daily dose is about 1 to 1000 mg, preferably about 3 to
500 mg, more preferably about 10 to 350 mg of an active
ingredient (Compound (I) or a salt thereof), which may be
15 administered once or in two or three divided portions.

When Compound (I) or a salt thereof of the present
invention is administered parenterally, it may be usually
administered as a form of a solution (e.g. an injection).
A dose per time varies depending on a subject to be
20 administered, an organ to be targeted, symptom, an
administration method and the like. For example,
conveniently, about 0.01 mg to about 100 mg, preferably
about 0.01 to about 50 mg, more preferably about 0.01 to
about 20 mg per kg body weight of Compound (I) or a salt

The injection thus obtained is usually filled in an ampule.

The pharmaceutical composition of the present

invention can be appropriately used in combination with a drug (hereinafter, abbreviated as a concomitant drug) such as a thrombolytic agent (e.g. TPA, urokinase etc.), an Alzheimer's disease treating drug (e.g. Avan, Calan etc.),
5 a cholesterol treating drug (e.g. an HMG-CoA reductase inhibitor such as simvastatin, pravastatin etc.), a TG lowering drug (e.g. clofibrate etc.), an AII antagonist (e.g. candesartan cilexetil, losartan etc.), an anti-platelet drug (e.g. clopidogrel, abciximab, aspirin etc.),
10 a Ca antagonist (e.g. Calslot, amlodipine etc.), an ACE inhibitor (e.g. enalapril, captopril etc.), a β blocker (e.g. metoprolol, carvedilol etc.) or an antiarrhythmic drug (e.g. procaine amide etc.). The concomitant drug may be a low-molecular compound, a high-molecular protein, a
15 polypeptide, an antibody, or a vaccine. An administration mode of the compound of the present invention and a concomitant drug is not limited particularly, as long as the compound of the present invention and the concomitant drug are combined upon administration. For example, such
20 an administration mode includes (1) administration of a single preparation obtained by formulating the compound of the present invention and a concomitant drug simultaneously, (2) simultaneous administration of two kinds of preparations obtained by formulating the compound of the
25 present invention and a concomitant drug separately, via a

single administration route, (3) separate administration at an interval of two kinds of preparations obtained by formulating the compound of the present invention and a concomitant drug separately, via a single administration route, (4) simultaneous administration of two kinds of preparations obtained by formulating the compound of the present invention and a concomitant drug separately, via different administration routes, and (5) separate administration at an interval of two kinds of preparations obtained by formulating the compound of the present invention and a concomitant drug separately, via different administration routes (e.g. administration of the compound of the present invention followed by the concomitant drug, or administration in the reverse order). The dose of a concomitant drug can be selected appropriately on the basis of a dose clinically used. In addition, a combination ratio of the compound of the present invention and a concomitant drug can be selected appropriately depending on a subject to be administered, an administration route, a disease to be treated, symptom, and a combination thereof. For example, when a subject to be administered is a human, 0.01 to 100 parts by weight of a concomitant drug may be used based on 1 part by weight of the compound of the present invention.

46a) Tert-butyl 4-hydroxy-4-(7-oxo-6,7-dihydro-5H-pyrrolo[1,2-c]imidazol-6-yl)piperidine-1-carboxylate

Under argon atmosphere, a solution of bis(trimethylsilyl)amidolithium in hexane (1.0 M, 13 mL)
 25 was diluted with THF(10 mL) and then cooled to -60°C. To

this solution was added dropwise a solution of 5,6-dihydro-7H-pyrrolo[1,2-c]imidazol-7-one (C. Christine et al.

Tetrahedron, 56, 1837 (2000)) (1.0 g) in THF (50 mL) at -60°C. The mixture was stirred at that temperature for 2

5 hours. To the mixture were added a suspension of anhydrous cerium chloride (3.0 g) in THF (20 mL) at -60°C and then a solution of tert-butyl 4-oxopiperidine-1-carboxylate (1.4 g) in THF (20 mL) dropwise, and the mixture was stirred at the same temperature for 3 hours. After addition of an
10 aqueous saturated ammonium chloride solution (50 mL) at -60°C, the mixture was warmed to room temperature and then extracted with chloroform (50 mL). An organic layer was separated and dried over anhydrous magnesium sulfate, and the solvent was distilled off. The residue was purified

10 Experimental Example 1

(1) Human activated blood coagulation factor X (FXa) inhibitory activity

Experimental method: 225 μ l of a 0.05 M Tris-HCl buffer (pH 8.3) containing 0.145 M sodium chloride and 2 mM calcium chloride, 5 μ l of a sample (a test compound was dissolved in dimethyl sulfoxide) and 10 μ l of human FXa (0.3 unit/ml) were added to a 96-well microplate and incubated at 37°C for about 10 minutes. Then, 10 μ l of a substrate (3 mM, S-2765) was added to the plate and incubated at 37°C for 10 minutes. After stopping the reaction by adding 25 μ l of a 50 % aqueous acetic acid, a change in absorbance at 405 nm was measured with a spectrophotometer, and the concentration (IC_{50}) at which 50 % of FXa activity was inhibited was calculated.

(2) In vitro coagulation time measuring method

(2-1) Extrinsic coagulation time (PT) measuring method:

Extrinsic coagulation time was measured with an automatic blood coagulation time measuring apparatus (STA compact, DIAGNOSTICA STAGO) using a PT reagent (DIAGNOSTICA STAGO). To 97 μ l of human normal plasma (fresh human plasma FFP, Sekisui Chemical Co., Ltd.), 3 μ l of a drug was added and preincubated at 37°C for 4 minutes. To 50 μ l of the said plasma, 100 μ l of a rabbit brain-derived tissue thromboplastin solution was added and then, a time required for coagulation was measured. A drug dissolved in dimethyl sulfoxide (DMSO) was used. The concentration of a drug required for 2-fold extension of a coagulation time was calculated based on a coagulation time when DMSO was added in place of the drug.

(2-2) Intrinsic coagulation time (APTT) measuring method:

Intrinsic coagulation time was measured with an automatical blood coagulation time measuring apparatus using STA-APTT-LT (DIAGNOSTICA STAGO). To 97 μ l of human normal plasma, 3 μ l of a drug was added. To 50 μ l of the plasma, 50 μ l of an activated partial thromboplastin solution was added and preincubated at 37°C for 4 minutes. Then, 50 μ l of a 25 mmol/l CaCl_2 solution was added, and a time required for coagulation was measured. A drug

dissolved in DMSO was used. The concentration of a drug required for 2-fold extension of a coagulation time was calculated as described in (2-1).

5 (2-3) Thrombin coagulation time (TT) measuring method:

Thrombin coagulation time was measured with an automatic coagulation measuring apparatus using a fibrinogen reagent (DIAGNOSTICA STAGO). A fibrinogen reagent (containing thrombin) was dissolved in 5 mL of
10 distilled water and then diluted 20-fold with a physiological saline supplemented with 0.5% bovine serum albumin. To 97 μ l of human normal plasma (fresh human plasma FFP, Sekisui Chemical CO., Ltd.), 3 μ l of a drug was added and preincubated at 37°C for 3 minutes. To 50 μ l of
15 the said plasma, 100 μ l of a thrombin solution was added, and a time required for coagulation was measured. A drug dissolved in DMSO was used. The concentration of a drug required for 2-fold extension of a coagulation time was calculated as described in (2-1).

20

(3) Ex vivo coagulation time measuring method (mouse)

(3-1) Intravenous administration:

A male ICR mouse (25-35 g, CLEA Japan Inc.) was used. To a mouse anesthetized with pentobarbital (50 mg/kg, i.p.),
25 5 ml/kg of a drug was administered once via a tail vein.

After 5 minutes from administration, 0.8 ml of blood was taken from an abdominal aorta or heart using 1/10 volume of 3.8% sodium citrate (Citrал, Yamanouchi Seiyaku) and then centrifuged at 3000rpm for 15 minutes to obtain plasma. To 5 50 μ l of the said plasma, 100 μ l of a rabbit brain-derived tissue thromboplastin solution was added, and a time required for coagulation was measured. A coagulation time was measured with an automatic coagulation time measuring apparatus (STA compact) using a PT reagent (DIAGNOSTICA 10 ATAGO). A drug dissolved in a mixed solution of dimethylacetamide and 1/10 N hydrochloric acid was used. A mixed solution of dimethylacetamide and 1/10 N hydrochloric acid was administered to a control group in place of the drug. The activity of the drug was expressed as the ratio 15 (%) of a coagulation time of a drug-administered group to a coagulation time of a control group.

(3-2) Oral administration:

A male ICR mouse (25-35 g, Nippon Crea) was used. To 20 a mouse which had been fasted for 12 hours or longer, 5 ml/kg of a drug was forced to be orally administered. After an hour from administration, blood was taken from an abdominal aorta under pentobarbital (50 mg/kg, i.p.) anesthesia. A drug suspended in 0.5% methylcellulose was 25 used, and 0.5 % methylcellulose in place of a drug was

administered to a control group. Others were as described in (3-1).

(4) In vivo antithrombotic activity measuring method

5 (4-1) Rat arteriovenous shunt method:

The method was according to the method of Umetsu et al. (Thromb. Haemostas., 39, 74-73, (1978)). A male SD rat (200-350 g, Nippon Crea) was used. An extracorporeal circulation path made of a polyethylene tube provided with
10 a silk thread was placed between the left jugular and right jugular vein of a mouse anesthetized with pentobarbital (50 mg/kg, i.p.). In order to prevent blood coagulation, the tube was previously filled with a physiological saline containing heparin (50U/ml). Blood was circulated for 15
15 minutes, during which the wet weight of a thrombus attached to the silk thread was measured. A drug was administered orally or intravenously. In the case of oral administration, a drug (2 ml/kg) suspended in 0.5% methylcellulose was administered under fasting and 0.5 %
20 methylcellulose was administered to a control group instead of a drug. In the case of intravenously administration, a drug (1 ml/kg) dissolved in a physiological saline was administered via a tail vein, and a physiological saline was administered to a control group instead of a drug. The
25 activity of the drug was calculated as the ratio (%) of a

thrombus wet weight of a drug-administered group to a thrombus wet weight of a control group.

(4-2) Rat abdominal vena cava partial ligation model

5 A male SD rat (200-400 g, Nippon Crea) was used.
After the abdominal vena cava of a mouse anesthetized with pentobarbital (50 mg/kg, i.p.) was carefully peeled, two ligatures were put round a renal vein branched part of the abdominal vena cava and a place 1 cm downstream therefrom
10 respectively so that all branches between them were ligated. A balloon catheter (Fogarty 2F, Baxter) was inserted via the left femoral vein and the balloon was then dilated with a 200-300 ml air to damage three times between the two ligatures. The balloon catheter was taken out. The
15 ligature put round the renal vein branched part was tied with a 26G needle and the needle was then taken out, thereby a partial ligation was made. After 30 minutes, the other ligature was tied, and a thrombus formed between the two ligatures was carefully isolated. The wet weight of
20 the thrombus was measured using an analysis balance equipped with a windscreen (BP110S, Satorius). A drug was administered orally or intravenously as described in (4-1). The activity of the drug was calculated as described in (4-1).

(4-3) Rat deep vein thrombosis (DVT) model

A male SD rat (200-350 g, Nippon Crea) was used. A polyethylene tube was inserted into the left femoral vein of a mouse anesthetized with pentobarbital (50 mg/kg, i.p.).

5 A silk thread (length 5cm) connected to a guide wire was inserted into the polyethylene tube and the tube was filled with a physiological saline containing heparin (50U/ml) in order to prevent blood coagulation. After the polyethylene tube was inserted to reach the abdominal vena cava, the

10 silk thread was allowed to be stood in the abdominal vena cava using the guide wire. After 30 minutes, heparin (200U/kg) was intravenously administered via a tail vein. After exsanguinations by cutting of an upper arm artery, the abdominal part was opened to take out the silk thread

15 and the wet weight of thrombus attached thereto (including weight of silk thread) was measured. A drug was administered orally or intravenously as described in (4-1). The wet weight of only thrombus was calculated using the equation: (wet weight of thrombus attached to silk thread)

20 - (wet weight measured of silk thread immersed in a venous blood sample collected using heparin). The activity of the drug was calculated as described in (4-1).
